

WORKPLACE COLLABORATION TECHNOLOGIES

EMERGING TECHNOLOGIES AND TOOLS

APIS AND INTEGRATION

APIs enable employees to work together efficiently by processing requests and creating seamless communication between the different applications that they use.

AUTOMATION

Automating mundane and time-consuming tasks to improve personal productivity and create an impressive collaborative environment among co-workers and customers.

VIRTUAL ASSISTANTS

Smart VA can help with taking notes, scheduling meetings and scanning emails for important info, thus creating more time for employees to interact and improve their collaboration.

VR & AR

VR technologies such as RealSense allow users to deliver presentations via live streams, and AR allows users to experiment and experience different collaborative settings before committing.

BOTTOM LINE

In essence, the processes of applying new technologies should not force employees to work across multiple interfaces as this creates a sense of inadequacy in terms of the integration of the work applications they use, leaving them frustrated.
